Week 15

Question 01:

Given an array of integers, reverse the given array in place using an index and loop rather than a built-in function.

Example

```
arr = [1, 3, 2, 4, 5]
```

Return the array [5, 4, 2, 3, 1] which is the reverse of the input array.

Function Description

Complete the function reverseArray in the editor below.

reverseArray has the following parameter(s):

int arr[n]: an array of integers

Return

int[n]: the array in reverse order

Constraints

 $1 \le n \le 100$

 $0 < arr[i] \le 100$

Input Format For Custom Testing

The first line contains an integer, *n*, the number of elements in *arr*.

Each line i of the n subsequent lines (where $0 \le i < n$) contains an integer, arr[i].

Sample Case 0

4

5

Sample Output

5

| 4 |
|---|
| 2 |
| 3 |
| 1 |
| Explanation |
| The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1]. |

| 10 |
| 21 |
| 45 |
| Sample Output |
| 45 |
| 21 |
| 10 |
| 17 |
| Explanation |
| The input array is [17, 10, 21, 45], so the reverse of the input array is [45, 21, 10, 17]. |

```
* Complete the 'reverseArray' function below.
 3
     * The function is expected to return an INTEGER ARRAY.
 4
     * The function accepts INTEGER ARRAY arr as parameter.
 5
 6
 7
 8 *
    * To return the integer array from the function, you should:
9
10
           - Store the size of the array to be returned in the result count var
           - Allocate the array statically or dynamically
11
12
13
     * For example,
     * int* return_integer_array_using_static_allocation(int* result_count) {
14 ▼
           *result count = 5;
15
16
           static int a[5] = \{1, 2, 3, 4, 5\};
17
18
19
           return a;
     * }
20
21
     * int* return integer array using dynamic allocation(int* result count) {
22 🔻
           *result count = 5;
```

```
24
25
           int *a = malloc(5 * sizeof(int));
26
27 •
           for (int i = 0; i < 5; i++) {
                *(a + i) = i + 1;
28
29
30
31
           return a;
32
33
34
    int* reverseArray(int arr_count, int *arr, int *result_count) {
35 ▼
36
        *result count = arr count;
        for (int i = 0; i < arr count/2; i++){
37 ▼
             int temp = arr[i];
38
39
            arr[i] = arr[arr_count-i-1];
            arr[arr count-i-1] = temp;
40
41
42
        return arr;
43
    }
44
45
```

Output:

| | Test | Expected | Got | |
|---|---|----------|-----|---|
| ~ | int arr[] = {1, 3, 2, 4, 5}; | 5 | 5 | ~ |
| | int result_count; | 4 | 4 | |
| | <pre>int* result = reverseArray(5, arr, &result_count);</pre> | 2 | 2 | |
| | for (int i = 0; i < result_count; i++) | 3 | 3 | |
| | <pre>printf("%d\n", *(result + i));</pre> | 1 | 1 | |

Question 02:

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of *minLength* or more, and it can only make one cut at a time. Given the array *lengths* representing the desired lengths of each segment, determine if it is possible to make the necessary cuts using this machine. The rod is marked into lengths already, in the order given.

Example

```
n = 3
lengths = [4, 3, 2]
minLength = 7
```

The rod is initially sum(lengths) = 4 + 3 + 2 = 9 units long. First cut off the segment of length 4 + 3 = 7 leaving a rod 9 - 7 = 2. Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to minLength = 7, the final cut can be made. Return "Possible".

Example

```
n = 3
lengths = [4, 2, 3]
minLength = 7
```

The rod is initially sum(lengths) = 4 + 2 + 3 = 9 units long. In this case, the initial cut can be of length 4 or 4 + 2 = 6. Regardless of the length of the first cut, the remaining piece will be shorter than minLength. Because n - 1 = 2 cuts cannot be made, the answer is "Impossible".

Function Description

Complete the function *cutThemAll* in the editor below.

cutThemAll has the following parameter(s):

int lengths[n]: the lengths of the segments, in order

int minLength: the minimum length the machine can accept

Returns

string: "Possible" if all n-1 cuts can be made. Otherwise, return the string "Impossible".

Constraints

- · 2 ≤ n ≤ 105
- $1 \le t \le 109$
- 1 ≤ lengths[i] ≤ 109
- The sum of the elements of lengths equals the uncut rod length.

Input Format For Custom Testing

The first line contains an integer, *n*, the number of elements in *lengths*.

Each line i of the n subsequent lines (where $0 \le i < n$) contains an integer, lengths[i].

The next line contains an integer, minLength, the minimum length accepted by the machine.

Sample Case 0

Sample Input For Custom Testing

STDIN Function

```
-----
```

```
4 \rightarrow lengths[] size n = 4
```

$$3 \rightarrow lengths[] = [3, 5, 4, 3]$$

5

4

3

9 \rightarrow minLength= 9

Sample Output

Possible

Explanation

The uncut rod is 3 + 5 + 4 + 3 = 15 units long. Cut the rod into lengths of 3 + 5 + 4 = 12 and 3. Then cut the 12 unit piece into lengths 3 and 5 + 4 = 9. The remaining segment is 5 + 4 = 9 units and that is long enough to make the final cut.

Sample Case 1

Sample Input For Custom Testing

STDIN Function

- $3 \rightarrow lengths[] size n = 3$
- $5 \rightarrow lengths[] = [5, 6, 2]$

6

2

 $12 \rightarrow minLength = 12$

Sample Output

Impossible

Explanation

The uncut rod is 5 + 6 + 2 = 13 units long. After making either cut, the rod will be too short to make the second cut.

```
neset answer
  1 •
      * Complete the 'cutThemAll' function below.
  2
  3
      * The function is expected to return a STRING.
 4
      * The function accepts following parameters:
  5
  6
      * 1. LONG INTEGER ARRAY lengths
      * 2. LONG_INTEGER minLength
  7
  8
 9
10 ▼
      * To return the string from the function, you should either do static all
11
12
13
      * For example,
      * char* return_string_using_static_allocation() {
 14 •
            static char s[] = "static allocation of string";
15
16
17
            return s;
18
 19
      * char* return string using dynamic allocation() {
 20 •
            char* s = malloc(100 * sizeof(char));
 21
 22
            s = "dynamic allocation of string";
 23
 24
 25
            return s;
```

```
26
     *
27
     */
28
    char* cutThemAll(int lengths_count, long *lengths, long minLength) {
29 •
         long t = 0, i = 1;
30
         for (int i=0;i<=lengths_count-1;i++){</pre>
31 •
             t +=lengths[i];
32
         }
33
         do{
34 ▼
             if (t-lengths[lengths_count-i-1] < minLength){</pre>
35 ▼
                 return "Impossible";
36
37
38
39
             i++;
         }while (i < lengths_count-1);</pre>
40
         return "Possible";
41
42
    }
43
44
```

Output:

| | Test | Expected | Got | |
|----------|---|------------|------------|---|
| ~ | <pre>long lengths[] = {3, 5, 4, 3}; printf("%s", cutThemAll(4, lengths, 9))</pre> | Possible | Possible | ~ |
| ~ | <pre>long lengths[] = {5, 6, 2}; printf("%s", cutThemAll(3, lengths, 12))</pre> | Impossible | Impossible | ~ |

Passed all tests! 🗸
